**Course Code:**

## 1. Project : Student Attendance Management System (SAMS)

**Application:** Console-based (CLI) Java application using Maven and JDBC for MySQL persistence.

### 1. Introduction:

Maintaining accurate student attendance is a crucial requirement for all educational institutions. The traditional method of using paper registers for attendance tracking is inefficient, prone to errors, and challenging to manage over extended periods. Faculty members often find tasks such as searching for a specific student's attendance, generating comprehensive reports, or calculating attendance percentages to be time-consuming and arduous.

To address these significant challenges, we propose the **Student Attendance Management System (SAMS)**. This is a **command-line application** developed using **Java**. It utilizes **Maven** for project management, **JDBC** for connecting to the database, and **MySQL** as the backend data store.

The primary functions of SAMS are designed to assist faculty by enabling them to:

- Effectively add and manage student records.
- Create and organize courses and subjects.
- Mark daily subject-wise attendance.
- Update or correct existing attendance records as necessary.
- Generate various detailed reports (e.g., student-specific, subject-specific, or date-range based).

The core focus of this project is to achieve **simplicity**, **accuracy**, and **efficiency** in attendance management. Although currently a command-line interface, the system has been developed with a modular architecture to facilitate easy future migration to a graphical user interface (GUI) or a web-based application.

### 3. Objectives of the Student Attendance Management System:

The core aims of developing this computer-based **Student Attendance Management System** are:

1. **Automation:** To transition from manual, paper-based attendance tracking to an efficient, automated system for colleges and schools.
2. **Efficiency and Labor Reduction:** To significantly decrease the administrative burden and manual effort associated with maintaining physical registers and calculating attendance percentages.
3. **Secure Data Management:** To ensure attendance records are stored reliably and securely within a MySQL database, facilitating easy retrieval, modification, and detailed analysis.
4. **Enhanced Reporting:** To provide capabilities for generating quick and comprehensive reports and search results for individual students, specific subjects, or entire classes.
5. **Error Minimization:** To drastically reduce common human errors, such as incorrect roll numbers, duplicate entries, or miscalculations in attendance.
6. **Future Scalability:** To establish a flexible and scalable architecture that allows for the seamless integration of future enhancements (e.g., SMS/email notification alerts, dedicated student login portals, etc.).

### 4. Project Category & Technology Stack:

#### Category:

- Application Software / Database Management System
- **Specific Project Category:** Database Management & Automation (The core function is efficient storage, management, and retrieval of student attendance data.)

#### Project Type:

- Console-based (Command Line) application

#### Technology Used:

| Component             | Technology | Connectivity             |
|-----------------------|------------|--------------------------|
| Programming Language  | Java       | - ▾                      |
| Build Tool            | Maven      | - ▾                      |
| Database              | MySQL      | - ▾                      |
| Database Connectivity | -          | JDBC (Java Database... ▾ |

## **5. Analysis**

### **5.1 Modules and Functionality:**

| Module                                          | Description                                     | Key Functionality                                                          |
|-------------------------------------------------|-------------------------------------------------|----------------------------------------------------------------------------|
| <b>Authentication (Optional / Simple Login)</b> | Manages secure access to the system.            | - Simple username/password login for admin/faculty.                        |
|                                                 |                                                 | - Validates credentials against user/faculty records.                      |
|                                                 |                                                 | - Prevents unauthorized access to attendance data.                         |
| <b>Student Management</b>                       | Handles the maintenance of student information. | - Add new students (roll no, name, course, semester, section, contact).    |
|                                                 |                                                 | - View comprehensive student list.                                         |
|                                                 |                                                 | - Update student details (phone, email, status).                           |
|                                                 |                                                 | - Deactivate/activate students (e.g., for pass-outs or drops).             |
| <b>Faculty Management</b>                       | Stores and manages faculty personnel data.      | - Store faculty details (name, email, phone, login credentials, role).     |
|                                                 |                                                 | - Links faculty members to the subjects they teach for attendance marking. |
| <b>Course &amp; Subject Management</b>          | Organizes the academic structure.               | - Define new courses (e.g., B.Tech CSE, BCA).                              |
|                                                 |                                                 | - Add subjects with code, name, and semester association.                  |
|                                                 |                                                 | - Map subjects to teaching faculty.                                        |
|                                                 |                                                 | - Maintain the total number of scheduled lectures per subject.             |

|                                 |                                                                 |                                                                                                  |
|---------------------------------|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>Attendance Management</b>    | The core module for recording and managing attendance.          | - Selection based on: course → semester → section → subject → date.                              |
|                                 |                                                                 | - Displays the list of students for the selected class.                                          |
|                                 |                                                                 | - Allows marking as <b>Present (P)</b> , <b>Absent (A)</b> , or <b>Leave (L)</b> .               |
|                                 |                                                                 | - Saves records to the attendance table via JDBC.                                                |
|                                 |                                                                 | - Permits updating attendance for corrections on a specific date.                                |
| <b>Report Generation</b>        | Provides tools for viewing and exporting attendance statistics. | - <b>Student-wise report</b> (attendance percentage for a student in a selected subject).        |
|                                 |                                                                 | - <b>Subject-wise report</b> (list of students with their attendance percentage in the subject). |
|                                 |                                                                 | - <b>Date-wise report</b> (attendance records for a particular date and subject).                |
|                                 |                                                                 | - Option to display/export reports in a tabular console format.                                  |
| <b>Utility &amp; Validation</b> | Ensures data integrity and system stability.                    | - Input validation (e.g., correct roll numbers, valid dates).                                    |
|                                 |                                                                 | - Database connection handler using JDBC.                                                        |
|                                 |                                                                 | - Error handling and presentation of relevant messages (e.g., database connection issues).       |

## **5.2 Database Design:**

**Proposed Database Name: student\_attendance\_db**

**Table 1 : Students**

| Field        | Datatype                | Properties              |
|--------------|-------------------------|-------------------------|
| student_id   | INT ▾                   | primary key ▾           |
| roll_number  | VARCHAR(50) ▾           | unique, not null ▾      |
| student_name | VARCHAR(200) ▾          | not null ▾              |
| course_id    | INT ▾                   | foreign key, not null ▾ |
| semester     | INT ▾                   | not null ▾              |
| section      | VARCHAR(20) ▾           | not null ▾              |
| phone        | VARCHAR(20) ▾           | not null ▾              |
| email        | VARCHAR(100) ▾          | not null ▾              |
| status       | ENUM('ACTIVE','INA... ▾ | not null ▾              |

**Relation: Each student belongs to one course.**

**Table 2 : Courses**

| Field         | Datatype     | Properties    |
|---------------|--------------|---------------|
| course_id     | INT          | primary key ▾ |
| course_name   | VARCHAR(200) | not null ▾    |
| branch        | VARCHAR(100) | not null ▾    |
| academic_year | VARCHAR(20)  | not null ▾    |

**Relation: One course can have many students & subjects.**

**Table 3 : Subjects**

| Field                  | Datatype       | Properties         |
|------------------------|----------------|--------------------|
| subject_id             | INT ▾          | primary key ▾      |
| course_id              | INT ▾          | foreign key ▾      |
| subject_code           | VARCHAR(50) ▾  | unique, not null ▾ |
| subject_name           | VARCHAR(200) ▾ | not null ▾         |
| semester               | INT ▾          | not null ▾         |
| total_lectures_planned | INT ▾          | not null ▾         |

**Relation: One course → many subjects.**

**Table 4 : Faculty**

| Field         | Datatype               | Properties         |
|---------------|------------------------|--------------------|
| faculty_id    | INT ▾                  | primary key ▾      |
| faculty_name  | VARCHAR(200) ▾         | not null ▾         |
| phone         | VARCHAR(20) ▾          | not null ▾         |
| email         | VARCHAR(100) ▾         | not null ▾         |
| username      | VARCHAR(100) ▾         | unique, not null ▾ |
| password_hash | VARCHAR(300) ▾         | not null ▾         |
| role          | ENUM('ADMIN','FAC... ▾ | not null ▾         |
| role          | ENUM('ADMIN','FAC... ▾ | not null ▾         |

**Relation: Faculty teaches subjects.**

**Table 5 : Class\_Subject\_Faculty**

| Field      | Datatype      | Properties    |
|------------|---------------|---------------|
| csf_id     | INT ▾         | primary key ▾ |
| course_id  | INT ▾         | foreign key ▾ |
| semester   | INT ▾         | not null ▾    |
| section    | VARCHAR(20) ▾ | not null ▾    |
| subject_id | INT ▾         | foreign key ▾ |
| faculty_id | INT ▾         | foreign key ▾ |

**Relation:** Mapping of which faculty teaches which subject to which class.

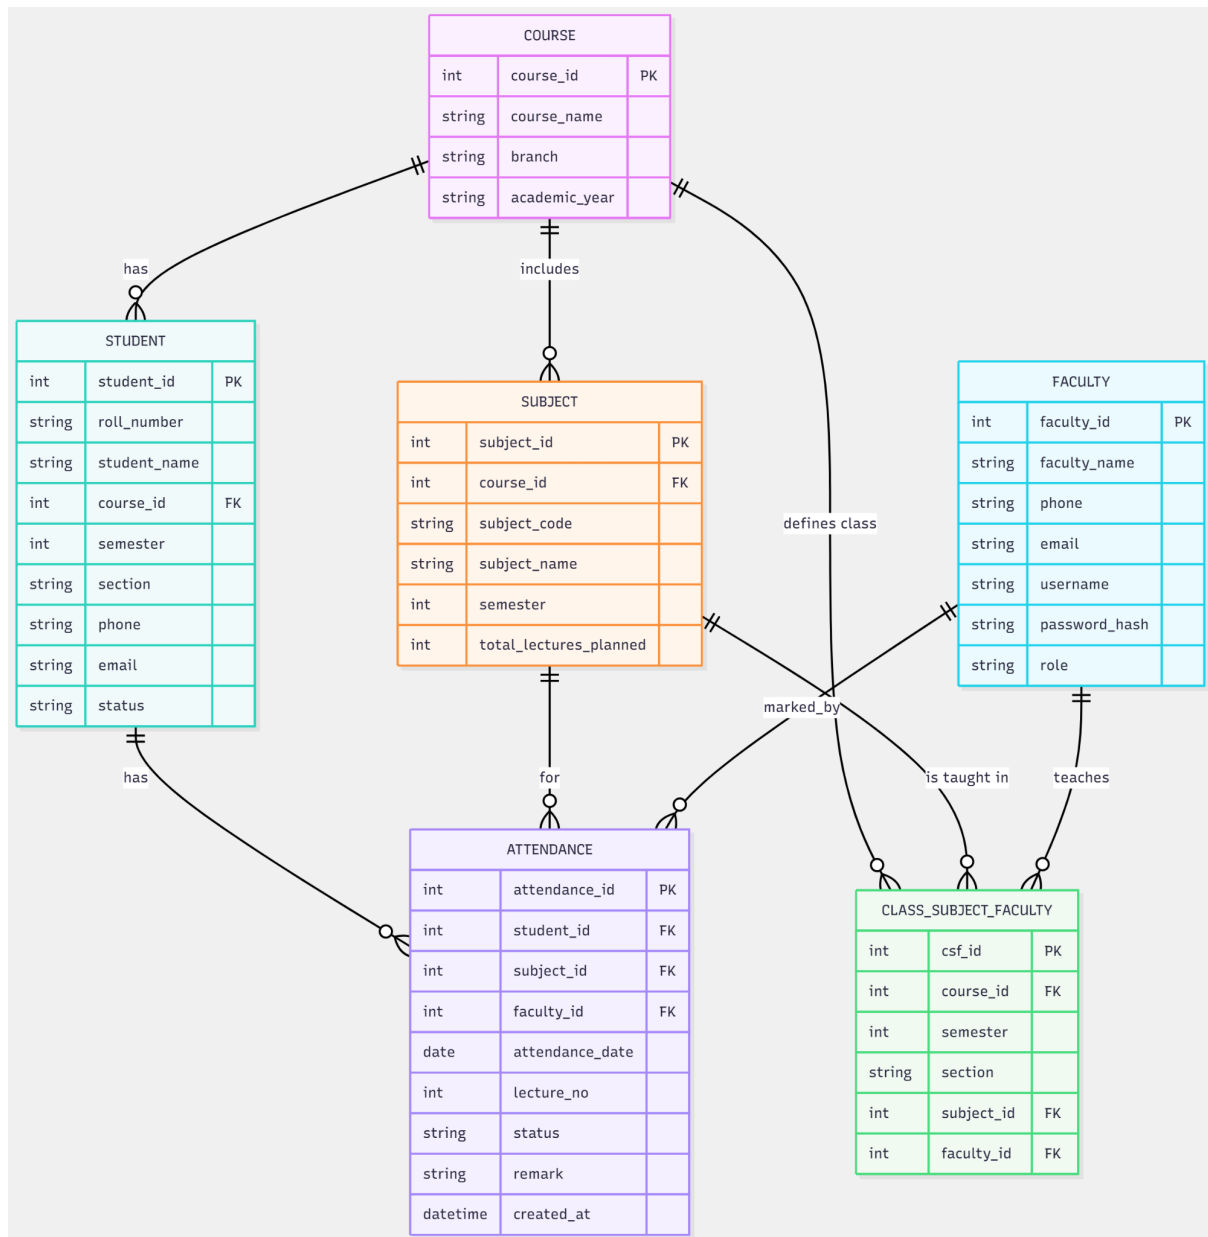

**Table 6 : Attendance**

| Field           | Datatype            | Properties    |
|-----------------|---------------------|---------------|
| attendance_id   | INT ▾               | primary key ▾ |
| student_id      | INT ▾               | foreign key ▾ |
| subject_id      | INT ▾               | foreign key ▾ |
| faculty_id      | INT ▾               | foreign key ▾ |
| attendance_date | DATE ▾              | not null ▾    |
| lecture_no      | INT ▾               | not null ▾    |
| status          | ENUM('P','A','L') ▾ | not null ▾    |
| remark          | VARCHAR(200) ▾      | nullable ▾    |
| created_at      | TIMESTAMP ▾         | not null ▾    |

**Relation:** Each attendance record is linked to student, subject & faculty.

## 5.4 Data Flow Diagrams:

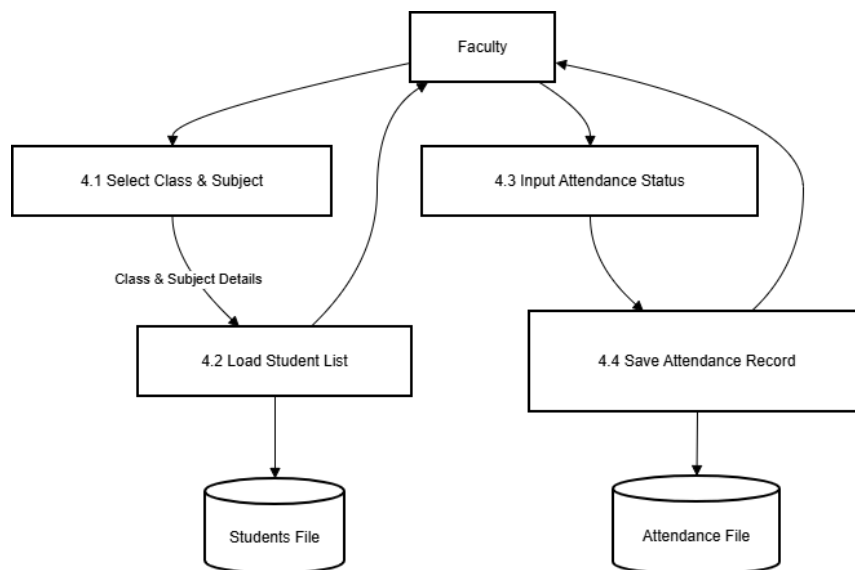

### Zero level DFD

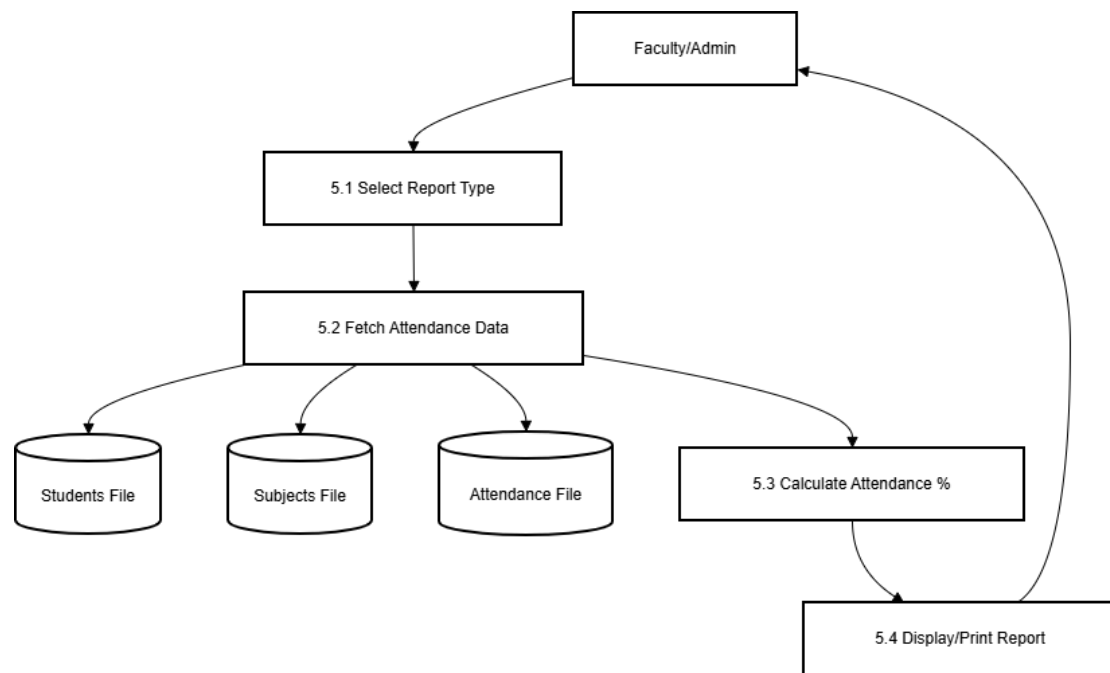

## 1st level DFD:

## 2nd level DFD:

## 6. Complete Structure (Process Logical Diagram):

## 7. Platform Requirements :

The project requires the following hardware and software specifications for development and operation:

### 7.1 Hardware Specifications:

| Component | Minimum Requirement         | Recommended Specification |
|-----------|-----------------------------|---------------------------|
| Processor | Intel Core i3 or equivalent | Intel Core i3 or higher   |

|                    |                                       |                                       |
|--------------------|---------------------------------------|---------------------------------------|
| <b>RAM</b>         | 4 GB                                  | 8 GB                                  |
| <b>Storage</b>     | 2 GB free space                       | At least 2 GB free space              |
| <b>Peripherals</b> | Standard monitor, keyboard, and mouse | Standard monitor, keyboard, and mouse |

## 7.2 Software Specifications:

| Category                                        | Requirement                                              |
|-------------------------------------------------|----------------------------------------------------------|
| <b>Operating System</b>                         | Windows 10/11 or Linux                                   |
| <b>Development Kit</b>                          | Java Development Kit (JDK 17 or JDK 21 LTS)              |
| <b>Build Tool</b>                               | Apache Maven                                             |
| <b>Integrated Development Environment (IDE)</b> | Any modern IDE (Eclipse, IntelliJ IDEA, or VS Code)      |
| <b>Database</b>                                 | MySQL 8.x, including the MySQL Connector/J (JDBC Driver) |
| <b>Other Tools</b>                              | Command Prompt/Terminal                                  |

## 8. Proposed Future Enhancements for the Attendance Management System

The current command-line based attendance management system can be significantly expanded and improved upon through the following future developments and integrations:

### 1. User Interface Modernization:

- **Graphical User Interface (GUI):** Transition the system from a command-line interface to a more intuitive, user-friendly desktop GUI application, potentially leveraging technologies such as JavaFX or Swing.
- **Web Application Development:** Convert the system into a fully functional web application, possibly using a framework like Spring Boot, to ensure broader and easier access for all users.

### 2. Enhanced Stakeholder Access:

- **Dedicated Secure Logins:** Implement distinct login portals for students and parents, enabling them to securely view real-time attendance records online.

### 3. Proactive Communication:

- **Automated Notification System:** Integrate a feature for sending automatic SMS and/or email notifications to relevant stakeholders (e.g., parents or

students). This would be triggered by critical events, such as a student's absence or when their attendance percentage falls below a mandated minimum threshold.

4. **Institutional System Integration:**

- **College ERP Synchronization:** Establish a connection between the attendance system and the College's existing Enterprise Resource Planning (ERP) system. This integration will facilitate seamless data exchange for related modules, including student grades, fee status, and academic timetables.

5. **Data Capture Automation:**

- **Biometric/RFID Implementation:** Introduce automation in the attendance marking process by integrating the system with biometric devices or Radio-Frequency Identification (RFID) card readers. This will reduce manual effort and minimize potential errors.

6. **Cloud Computing and Advanced Analytics:**

- **Cloud Data Migration:** Move the attendance data storage to a secure, scalable cloud platform.
- **In-Depth Data Analysis:** Utilize the accumulated data for sophisticated analytical purposes, including academic performance prediction, identification of attendance trends, and dropout analysis.

## **9. Bibliography**

The following textbooks and online resources were consulted during this project:

**Textbooks:**

1. Schildt, Herbert. *Java: The Complete Reference*. McGraw-Hill.
2. Korth, Silberchatz, Sudarshan. *Database System Concepts*. McGraw-Hill.
3. Patterson, James & Others. *Database Systems: A Practical Approach to Design, Implementation and Management*.
